DEHUMIDIFIER SIZING GUIDE

Dehumidifier capacity is usually measured in pints per 24 hours and is determined by two factors:

The size of the space that needs to be dehumidified, and the conditions that exist in the space before dehumidification. Use the chart below to estimate the capacity you are looking for.

Room Conditions	Small to mid-size space	Mid-size to large space	
Damp Area feels damp and has a musty odor only in humid weather	100 - 1,000 sq. ft. 1,000 - 2,000 sq. ft. D50 (50 pint)		
Very Damp 🍐 🍐 Area always feels damp & has a musty odor & may exhibit damp spots on walls & floors	D50 (50 pint)	D50 (50 pint)	
Wet b b b Area always feels and smells wet and the walls & floors sweat or seepage is present	D50 (50 pint)	D70 (70 pint)	
Extremely Wet A Area has wet floors or exhibits standing water	D50 (50 pint)	D70 (70 pint)

Mode	ι	Circuit Rating Breaker or T-D Fuse	Plug Face (NEMA)	Wall Outlet Appearance	Power Cord Length
All model	s	125V-15A	5-15P		6 FT.

*The rating is expressed in pints per 24 hour period at 80° F and 60% relative humidity. Dehumidifiers are tested using the ANSI/AHAM DH-1 standard.

**Energy Factor: The energy efficiency of dehumidifiers is measured by its energy factor, in liters of water removed per kilowatt-hour (kWh) of energy consumed or L/kWh. In general, a higher energy factor means a more efficient dehumidifier.
